Chapter 233: The Celestial Migration

The migration of humanity from Earth to the newly habitable planets and moons within the solar system marked the beginning of a new era. With the transformations brought about by the Second World Tree and the infusion of raw mana, worlds that once seemed hostile to life now offered the promise of new civilizations. As humanity expanded its reach across the stars, they needed efficient means to traverse the vast distances between their newfound homes.

---

1. The Expansion Across the Solar System

With Mercury, Venus, Moon, Mars, Jupiter, Saturn, Uranus, Neptune, Titan, Ceres, and Pluto now rendered habitable by the influence of the Second World Tree, humans set their sights on colonizing these worlds. Each of these planets and moons had been transformed into new homes, with rich mana-infused ecosystems and breathable atmospheres, perfect for sustaining life.

However, the vast distances between these celestial bodies required an advanced method of travel to facilitate migration and communication. This challenge was met by the creation of portals and spaceships, enabling humanity to reach the farthest reaches of the solar system.

---

2. The Role of the Second Clones

Sung Jin-Woo and Sung Su-Ho, in their divine forms, commanded their second clones—manifested from their own essences—to oversee the creation of portals. These portals were the key to efficient travel between planets and moons, allowing for quick movement without the need for long, resource-draining space voyages.

Strategic Placement: The second clones created portals at various key points across the solar system, ensuring that each planet and moon had a reliable, fast way to travel between worlds. These portals allowed for instantaneous travel, bypassing the time and energy required for traditional spacecraft journeys.

Portal Distribution:

Each habitable planet and moon was granted a minimum of six portals strategically placed to connect them to neighboring celestial bodies.

Larger planets, such as Jupiter, Saturn, Uranus, and Neptune, were given more than a hundred portals scattered across their immense surfaces. These portals served not only as travel routes but also as hubs for trade, communication, and movement of resources.

Portal Network Efficiency: The portals were linked to a central mana network, drawing upon the raw mana from the core of each planet and moon. This ensured that the portals were stable and could handle the vast amount of traffic and energy

needed for interplanetary travel.

---

3. The Transformation of Human Civilization

The ability to travel quickly and easily between planets and moons revolutionized human civilization. No longer confined to Earth, humanity began to spread across the solar system, establishing colonies on previously inhospitable worlds.

Mercury and Venus: With newly breathable atmospheres and fertile landscapes, these planets became the first to receive large influxes of settlers, quickly growing into bustling hubs of human activity.

Mars and the Moon: Already home to some of humanity's early space endeavors, these worlds flourished as vital points for resource extraction and scientific research, connecting the colonies to the portals that bridged the solar system.

Gas Giants and Their Moons: The moons of Jupiter, Saturn, Uranus, and Neptune transformed into new realms of civilization. Settlements grew beneath the icy exteriors of moons like Europa, Titan, and Triton, where human ingenuity turned inhospitable environments into thriving colonies.

Pluto and Ceres: These farthest reaches of the solar system, once thought to be on the edge of human exploration, became the frontier of humanity's reach. Their colonies, though small, were critical in gathering resources from the outer solar system.

---

4. Interplanetary Unity and Prosperity

As humanity's presence expanded, the solar system became interconnected by the vast network of portals. The creation of these portals did more than facilitate travel—it sparked a new era of cooperation, trade, and cultural exchange across the entire solar system.

Portal Hubs: Certain planets, such as Mars and Titan, became central hubs where the largest portal networks converged. These hubs were vibrant centers of commerce and diplomacy, where resources, knowledge, and cultures from across the system met.

Cooperation and Unity: The portals not only allowed for the swift movement of people and resources but also helped forge alliances and cooperation between the various colonies. Humanity, now spread across the stars, learned to work together, building a collective civilization that spanned the solar system.

---

5. The Vision of Sung Jin-Woo and Sung Su-Ho

From the Umbra Citadel, Sung Jin-Woo and Sung Su-Ho looked out upon the flourishing colonies of the solar system. The stars twinkled in the distance, and the planets that had once seemed so distant now pulsed with life and potential.

Sung Jin-Woo spoke, his voice carrying the weight of divine intent:
“This is only the beginning. The multiverse is vast, and our reach knows no limits. With every portal, with every step taken, humanity will flourish across the stars.”

Sung Su-Ho nodded, his eyes reflecting the endless possibilities ahead:
“Indeed, Father. The universe is ours to shape, and we will continue to guide humanity as they spread their wings among the stars.”

---

6. The Endless Journey

With the portals in place, humanity’s migration was far from over. The solar system had become their new home, but the seeds of colonization had been sown, and the journey to other realms of the multiverse would soon begin. With the portals acting as bridges to new worlds, humanity’s potential for growth and discovery was boundless, and the stars no longer seemed like distant, unreachable lights.

Through Sung Jin-Woo’s divine will, the multiverse had opened to humanity—an eternal journey of expansion and unity had begun.
